## Lyrics Sheet

### The Sun

The sun is just a common, mid-sized, yellow star.  
There are trillions of others like it in the universe.

It produces light, heat, and energy.

It's the closest star to earth.

The surface of the Sun is called photosphere.

It's made mostly of hydrogen and helium.

The Sun causes all the seasons and controls weather.

It's what makes plants grow.

*One million times the size of Earth.*

*93 million miles away.*

*14 million degrees Celsius.*

*Without it there would be no life for us.*

Without the Sun, the Earth would be a rock with no life.

Don't look too long at it or you will go blind.

It takes eight whole minutes for you to see its light.

It causes the Northern Lights.

The Sun is the largest object in our solar system.

It makes up 98% of all the matter here.

Sun spots are dark patches found on the Sun.

They come and go every 11 years.
